4549. TWO CASES OF ACUTE HAEMOLYTIC ANAEMIA WITH HAEMOGLOBIN-
URIA (Russian text) - Budagovskii M. T., Glezer G. I. and

Treskunov K. A. Moscow - SOV. MED. 1957, 8 (130-132);
Two cases of acute haemolytic anaemia with haemoglobinuria are reported, both following treatment with streptocid (a Soviet sulphonamide preparation of albucid type). In the first case acute haemolysis occurred in a patient aged 21 yr., suffering from epidemic parotitis, who had received streptocid and penicillin for 3 days. Copious administration of fluids, cardiac therapy, and blood transfusion (on the 6th day of illness) proved ineffective and the patient died. The second patient, aged 21 yr., had had malaria and chronic hepatocholecystitis and was, consequently, sensitized and liable to haemolytic processes. Following treatment with streptocid (at first up to 5 g. per day, then in smaller doses) for upper respiratory infection, fulminating intravascular haemolysis took place. Repeated transfusions of small amounts of blood led to recovery. More careful administration of streptocid is recommended in view of the possibility of development of acute haemolytic anaemia. Early use of blood transfusion may be an effective means of treating this severe and dangerous condition.

TOPIC TAGS: engine ignition system, transistorized circuit

ABSTRACT: This Author Certificate presents a transistorized chopper, e.g., for battery ignition systems of internal combustion engines. To protect the transistorized chopper from voltage surges when switching the ignition coil current, a varistor is connected in parallel with the collector-base junction of the transistorized chopper.

ABSTRACT: This Author Certificate presents a battery ignition system for internal combustion engines. The system contains a dc supply, an ignition coil, transistors (one or more), a chopper, and a transformer. The primary of the ignition coil is connected in the emitter-collector circuit, the chopper contacts are connected in the base circuit, and the secondary of the transformer is connected in parallel with the base-emitter junctions (see Fig. 1). To simplify the design, the primary of the transformer is connected in parallel with the primary of the

ABSTRACT: This Author Certificate introduces a battery ignition system for engines with carburetors consisting of battery, ignition coil, contact breaker, and two semiconductor triodes used as a current commutator in the primary winding of the ignition coil. To improve ignition reliability, the semiconductor triodes are connected in series with respect to current and reverse voltage, while the primary winding of the ignition coil is connected into the emitter or collector circuit. To increase the power of the ignition coil at low breaking current on the breaker contacts, the primary

ABSTRACT: This Author Certificate presents a battery ignition system for internal combustion engines. The system contains a dc source, an ignition coil, a transistor, and a transformer. The primary of the ignition coil is connected in the emitter-collector circuit of the transistor, and the breaker contacts are connected in the base circuit. The transformer secondary is connected in parallel with the base-emitter junction of the transistor. To create active cutoff of the transistor with minimal values of power and transformer size, the transformer primary is connected in series with the breaker contacts in the base circuit of the transistor (see Fig. 1). To improve the operating characteristics, several

transistors are connected in series (the collector of one transistor is connected to the emitter of the other). The bases are connected in parallel through protective diodes. The base-emitter junctions are shunted by the transformer secondaries. The transformer primary is connected in the base circuit of one or several transistors. To equalize the transistor voltages, equal resistances are connected between the emitter and collector of each transistor. Orig. art. has: 1 diagram.

Title: Experience of the Operation of a Plant for the Continuous Synthesis of Benzole

Periodical: Khim. i Tekhnol., 1976, No 7, pp. 11 - 12 (11)

Abstract: Operation of the plant for the continuous synthesis of benzole is described. The plant is located in the town of Yenakiyevo. Work in 1976 was aimed at a series of modifications. The scheme finally adopted is as follows: raw benzole-toluene-xylene fraction (95% distilla over at 140 - 145°C) and concentrated sulfuric acid flows from gravity tanks through proportioning equipment into a centrifugal pump where the initial mixing takes place, the pump passes the mixture through 8 mixing balls in series (250 mm diameter from cast iron) interconnected with 1" pipe forming an angle of 90° between the inlet and outlets. Here the main part of the reaction takes place. In order to prolong the time of contact of the fraction with the acid, the mixture is passed into a contact vessel (cylindrical vessel - 1.5 m diameter, 1.5 m length) and then into a separator. The separator is a vertical cylindrical vessel with a diameter of 1.5 m and a height of 1.5 m. The separator is equipped with a stirrer and a heating jacket. The separator is connected to a condenser and a fraction collector. The separator is equipped with a stirrer and a heating jacket. The separator is connected to a condenser and a fraction collector.

Experience of the Operation of a Plant for the Distillation of Benzole

Operation of a distillation plant on the benzole and a batch of the fraction distilled over (Table 1). The consumption of oil (at a separation of the benzole oil), amounts to 1.4 kg/ton of benzole. The main loss of benzole were decreased from 0.6 in 1955 to 0.9 in 1957 (Table 2). The literature data is presented for general use. There is 1 figure and 2 tables.

TITLE Utilization of the Pyrolysis Tar-Wash Product From
Synthetic Alcohol Plants

PERIODICAL Koks i khimiya, 1960. No. 1, pp 44-47

TEXT In utilizing petroleum and natural gas in the production of synthetic alcohol, the gases are cracked in order to increase their ethylene content. The tar formed during the process under the name of pyrolysis tar was treated as a waste product. The authors carried out an investigation of the chemical composition of this product in order to determine its possible application for the production of aromatic hydrocarbons. A sample of the tar from the Saratov Works was taken for the investigation (sp. gr. 0.373, IBB 65° 100° 54%, 125° 68%, 150° 75%, 180° 86%). Rectification on a column equivalent to 24 theoretical plates (Table 1) indicated that the tar contained about 50% of benzole, toluole, xylole and solvent naphtha. unsaturated compounds were distributed non-uniformly concentrating mainly in the head and

Card 1/3

00/000/001/004/006
E071/E433

Utilization of the Pyrolysis Tar-Wash Product From Synthetic
Alcohol Plants

bottom fractions. Laboratory investigations of the washed fraction boiling to 180°C (Table 2) indicated that it can be used for the production of pure benzole (synthetic grade). In view of high wash losses (35.9%), the boiling range of the fraction most suitable for further treatment was determined as 79 to 135°C. Laboratory results were confirmed on an industrial batch unit (Table 4). The following products can be obtained: heads and losses 19.7%, benzole 32.2%, toluole 12.2%, xylole 1.6%, solvent naphtha 13.8%, residues 16.2%, washing losses 4.3%. About 65% of benzole can be obtained of a synthetic grade. Residues contained about 63% of unsaturated suitable for the production of resins. However, the residue could not be processed together with benzole residues on the Works coumarene resin plant. Their further processing is being investigated. Industrial processing of the pyrolysis tar was started on the Works according to the scheme shown in Fig. 1. It consists of batch distillation with the collection of four fractions: forerunnings up to 70°C, BTX fraction (live steam) 79 to 90°C, solvent naphtha (live Card 2/3)

5/068/60/000/001/004/000
E071/E433

Utilization of the Pyrolysis Tar-Wash Product From Synthetic Alcohol Plants

steam) 90 to 100°C and still residues. The washed BTX fraction is distilled on a continuous plant with collection of pure benzole and BX residues. The latter are passed through a continuous toluene column with the collection of pure toluole and residues which are then processed in a batch unit with the collection of the TK fraction (returned to the toluene column) xylene, solvent naphtha and residues. It is concluded that at present the processing of the pyrolysis tar on existing coke oven plants would be advantageous. The design of a special central plant of a large capacity for the processing of all the available pyrolysis residues is recommended. There are 2 figures and 4 tables.

Title : The Correlation of Growth and Development of Pyramidal Cells in Different Cytoarchitectonic Fields of the Frontal Lobe in Human Postnatal Ontogenesis.

Orig Pub : Vestn. Mosk. un-ta, ser. biol., pochvoved., geol., geogr., 1956, No 2, 103-112

Abstract : An investigation was conducted of the growth and development of pyramidal cells in the central sections of cortex fields 4, 6, 8, 9, 10, 45 and 44 of the frontal lobe of the left brain hemisphere of 3 boys (from birth to 18 years of age). Older fields phylogenetically are most mature at birth in form and size of elements. In the phylogenetically youngest fields 44 and 45 of an 18-year old, the elements in the upper level of the cortex are

AUTHOR: Glezer M D

TITLE: Determination of Steel Quality From Hairline Cracks

PERIODICAL: Standartizatsiya, 1960, No 10 pp 37 39

TEXT: This is a report on a new method of determining the quality of steel from hairline cracks. The principal determinations are the following: 1) Cracked metal is checked only by determination of cracks on the surface of finished material. 2) The manufacturer is held responsible for the quality of metal if the area occupied by such cracks exceeds the standard. The cracks are detected by means of Magnoflex (magnofloks). 3) Unification of standards for permissible hairline cracks, referring to the unit area of the checked surface (Table). The new method was approved at a meeting convened by the Chelyabinskiy sovnarkhoz (Chelyabinsk sovnarkhoz) and attended by representatives of the metallurgical plants of the Chelyabinsk sovnarkhoz, Sverdlovskiy sovnarkhoz (Sverdlovsk sovnarkhoz), and Moskovskiy (oblastnoy) sovnarkhoz (Moscow (oblast') sovnarkhoz). There is 1 table.

Reaction of some chlorides of elements of group IV with acetoacetic ester. Yul' R. Val'nov, P. M. Glizer, and I. Ya. Raskina. *Sovetskii Khimicheskii Zhurnal*, 2, 975-8 (1964). To 10 g. $\text{AcCH}_2\text{CO}_2\text{Et}$ chilled with Dry Ice was added 5 g. SiCl_4 to yield yellow crystals of the adduct $(\text{AcCH}_2\text{CO}_2\text{Et})_2\text{SiCl}_2$, purified by air blowing while chilled with Dry Ice; the product hydrolyzes in H_2O , and vigorously evolves HCl in the dry state above h° . Dry-air blowing fusible at 100° , left behind a yellow product, $(\text{AcCH}_2\text{CO}_2\text{Et})_2\text{SiCl}_2$, decomp. about 250° (from petr. ether). Similarly was obtained $\text{AcCH}_2\text{CO}_2\text{Et} \cdot \text{SnCl}_4$, m. $132-3^\circ$, which on air blowing at 125° gave some sublimate of the starting material and a residue of $(\text{AcCH}_2\text{CO}_2\text{Et})_2\text{SnCl}_2$ insol. in org. solvents. Similarly was prepd. with free-solng $\text{AcCH}_2\text{CO}_2\text{Et} \cdot \text{TiCl}_4$, m. $115-17^\circ$, sol. in halogenated solvents; the product can be prepd. in ligroine soln. $\text{AcCH}_2\text{CO}_2\text{Et}$ (5 g.) added in Et_2O to 5.5 g. TiCl_4 in H_2O formed yellow $(\text{AcCH}_2\text{CO}_2\text{Et})_2\text{TiCl}_2$, m. $123-3^\circ$ (lit. Pithay, Ann. 311, 399(1906)). The former product, m. $115-17^\circ$, was air-blown 8 hrs. at 120° , yielding brown $(\text{AcCH}_2\text{CO}_2\text{Et})_2\text{TiCl}_2$. Mixing 3.5 g. PbCl_2 with 1.3 g. $\text{AcCH}_2\text{CO}_2\text{Et}$ at -73° gave yellow $\text{AcCH}_2\text{CO}_2\text{Et} \cdot \text{PbCl}_2$, which decomp. at 9° , yielding a liquid $(\text{AcCH}_2\text{CO}_2\text{Et})_2$ and a white solid (PbCl_2) . Title : Differences in the electrical activity of the brain of dogs with various types of higher nervous activity

Periodical : Dok. AN SSSR 99/3, 485-488, Nov 21, 1954

Abstract : Five dogs of definite typological characteristics were investigated to determine the differences in the electrical activity of their brain. The registration of the biotics was carried out on three zones of the dorsal surface of the cerebral cortex of one of the larger hemispheres - frontal, parietal and occipital. The results obtained are shown in electroencephalographs. Two USSR references (1951). Graphs.

Subject: The direction of the gaze

The direction of the gaze is the direction of both eyes in the direction of the stimulus. The time period is called the time lag from the start of the action of the stimulus to the rotation of the eye. The illuminating stimulus was placed at an angle of 60° to the plane of symmetry of the observer, whose vision was fixed either straight ahead (0°) or turned by 20° towards the stimulus (+20°) or by 20° away from the stimulus (-20°). It was observed that the smaller the angle between the initial direction of the vision and the direction towards the stimulus, the longer the time lag of the eye.
